

Installation

The schematic shows the principle of installation with an Automatic Switchover System which is recommended to assure continuous pH control. Control of gas injection is done by connecting the 230V pH control output of the CHEMTROL® controller to the solenoid valve on the CO2 injection line.

One or more CO2 gas cylinders can be manifolded together on each line, depending on the feed rate required to maintain proper pH. Select the proper pressure regulator as indicated below according to pool size.
